

BITS in Motion – Stop-motion Procedure – Design Room

- Set up the shooting area. The background was selected as white to see the BITS logo better.
- Set up the camera in front of the object, arrange the height and the position.
- Take your object into photoshoot stage.
- The object will be 4 individual pieces. Before shooting the stop-motion video, think how you are going to proceed with the steps.
- Stick the first object set into desired position in stage. This will be the starting point of the video.

- The second object set will be the first step of the stop-motion video. Move the second object set step by step and take a picture in each step to make the stop-motion effect.

- After the second set is done, the first and the second should be stayed in the frame. Then, repeat the procedure for the third and the fourth object set.
- Now you will have the stop-motion video for BITS logo.
